New isolated lysolipid/EDG receptor useful in the treatment of asthma and rheumatoid arthritis.

Claim 7; Fig 16B; 120pp; English.

A novel isolated lysolipid (LL) receptor/EDG receptor (EDG-4). The LL/EDG receptors are involved in an inflammatory response signaling pathway and an apoptotic signaling pathway. They can be used for identifying sgonists or antagonists of NF-kB or IL-8 modulated EDG or LL receptors. Agonists can be used for upregulation of an inflammatory process condition or immune response. Antagonists can be used for the downregulation of an inflammatory process condition or immune response. The agonists and antagonists can also be used for controlling apoptosis in a cell comprising the LL/EDG receptor. A diagnostic test for aberrant early conditions of HEDG-4 can accelerate diagnosis and proper treatment of abnormal conditions of e.g. the heart, kidney, lung and testis. Specific examples

The present sequence is a human EDG family protein designated H218. H218

is used for diagnosing disease or its susceptibility in a subject related
with expression or activity of H218 by determining the presence or
absence of mutation in the polynucleotide encoding H218 in the genome of
the subject and/or analysing for the presence of H218 expression in
sample derived from the subject. It is also used for treating subjects in
need of enhanced activity or inhibition of H218 by administering an
agonist or antagonist respectively. H218 can be used to treat abnormal
conditions such as bacterial, fungal and viral infections, particularly
H1V-1 or 2, cancers, diabetes, obesity, anorexia, bullimia, asthma,
Parkinson's disease, acute heart failure, hypotension, hypertension,
curinary retention, osteoporosis, angina pectoris, myocardial infarction,
aigraine, vomiting, psychotic, neurological disorders and dyskinesias can
be treated. The H218 polynucleoride can also used for obtaining
hybridisation probes and primers for isolating full-length clones
encoding H218. The difference in CDNA or genomic sequence between
affected and unaffected individuals is determined to identify mutation
causing the disease. It is also valuable for chromosome identification.

```
c an event isolated lyeding an inflammatory response signaling pathway and an apoptotic signaling pathway. They can be used for identifying agonists or antagonists of NE-KB or IL-8 modulated EDG or iL receptors. Agonists or antagonists of NE-KB or IL-8 modulated EDG or iL receptors. Agonists or immune response. Antagonists can be used for the downregulation of an inflammatory process condition or immune response. The agonists and inflammatory process condition or immune response. The agonists and inflammatory process condition or immune response. The agonists and inflammatory process condition or immune response. The agonists and compression the LL/EDG receptor. A diagnostic test for aberrant expression of HEDG-4 can accelerate diagnosis and proper treatment of abnormal comprising the LL/EDG receptor. A diagnostic test for aberrant expression of HEDG-4 may play a role of e.g. the heart, kidney, lung and testis. Specific examples of conditions in which aberrant expression of HEDG-4 may play a role include adult respiratory distress, asthma, rheumatoid arthritis, stroke, cardiac ischemia, acute pancreatitis, septic shock, psoriasis, acute cyclosporine nephrotoxicity, HIV/AIDS, myelodysplasia, cirrhosis of the filver, and early diabetic glomerulopathy, as well as lung damage following exposure to cigarette smoke, asbestos or silica. HEDG-4 specific antibodies, inhibitors, ligands or their analogs can be used as specific antibodies, inhibitors, ligands or their analogs can be used as specific antibodies, inhibitors, ligands or their analogs can be used as specific antibodies, inhibitors, ligands or their analogs can be used as specific antibodies, inhibitors, ligands or their analogs can be used as specific antibodies, inhibitors, ligands or their analogs can be used as specific antibodies, inhibitors, ligands or kellowish acceleration, or the genes of kidney, lung, heart, or the nervous system of kidney, lung, heart, or the nervous system of kidney, lung, heart,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New isolated lysolipid/EDG receptor useful in the treatment of asthma and rheumatoid arthritis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       A novel isolated lysolipid (LL) receptor/EDG receptor (EDG-4). ```
The present sequence represents an Edg polypeptide. The specification describes Edg4 and Edg5 polypeptides. The Edg4 gene is located on chromosome 19p12. The Edg polypeptides are receptors for lysophospholipids and sphingolipids, such as lysophosphatidic acid (LPA) and sphingosine 1-phosphate (S1P). The Edg receptor proteins are used for diagnosing an LPA or S1P mediator condition an individual. Edg4 and Edg5 colypeptides can be used in screening assays designed to determine the effects of a candidate bioactive agent on the expression and activity of Edg4 and Edg5 polypeptides, and the function of LPA and S1P. Nucleotide sequences encoding Edg-4 and Edg-5 are useful as hybridisation probes, in chromosome and gene mapping and in the generation of anti-sense RNA and DNA. Nucleic acids which encode Edg4 or Edg5 or their modified forms can also be used to generate either transgenic animals or knock out animals.

The Edg receptors, are useful in a high-throughput screening assay to identify compounds that bind to or modulate the activity of the polypebtide, in calcium mobilisation assays, binding assays, detection of cAMP formation, or in reporter gene techniques

The method is especially useful for screening preventives or remedies for IgA nephritis. The present sequence is human Edg-5, which was used in the method of the invention

Identifying lymphocyte modulator activation/migration, by contacting an BDG G-protein coupled receptor polypeptide or cell having the polypeptide with compound and determining chemical/phenotypic effect of compound on cell.

Disclosure, Fig 2; 70pp; English.

The invention discloses method for identifying a compound that modulates lymphocyte activation/migration. The method comprises contacting an EDG (-protein coupled receptor (GPCR) family polypeptide, or its fragment or

cell comprising the polypeptide or its fragment with the compound, and determining the chemical/phenotypic effect of the compound upon the cell. Also disslosed are methods for modulating lymphocyte activation or migration in a subject, by administering to the subject a therapeutically effective amount of an identified compound, an EDG polypeptide or a conclain an EDG, or its fragment, and for screening for modulating or Ectivation, by transfecting into lymphocytes a condulators of lymphocyte activation, by transfecting into lymphocytes a condulating or B cell receptors of the lymphocytes activation of lymphocyte activation by detecting the level of CDG cell surface expression and rescuing cDNAs that modulate cylmphocyte activation. The method is useful for identifying a compound such as an antibody, antisense molecule, small organic molecule, cylmphocyte activation or apphingolipid analogue) that modulates lymphocyte cativation or migration. The compounds identified are useful for the treatment (e.g. gene therapy) of diseases such as asthma, allergy, cutofimmume diseases such as multiple solerosis, sclerosis, permicious and tissue transplant such as graft-versus-host disease, acute and chord inflammation, an infection such as viral, fungal, protozoal or chronic inflammation, an infection such as viral, fungal, protozoal or chronic inflammation, an infection such as viral, fungal, protozoal or chronic inflammation of lymphocyte migration is desired. The sequence and stimulation of lymphocyte migration is desired. The sequence corrected is the human EDG-5 protein 240 240 G protein-coupled receptor; GPCR; antigenic peptide; gene therapy; G protein-coupled receptor modulator; antibody; immune-related disease; growth-related disease; cell regeneration-related disease; AIDS; cancer; immunological-related cell proliferative disease; autoimmune disease; Alzheimer's disease; atherosclerosis; infection; osteoarthritis; allergy; osteoporosis; cardiomyopathy; inflammation; Crohn; s disease; diabetes; graft versus host disease; Parkinson's disease; multiple sclerosis; psoriasis; anxiety; depression; schizophrenia; dementia; memory loss; mental retardation; epilepsy; asthma; tuberculosis; obesity; nausea; 120 120 180 180 300 241 VFIVCWLPAFSILLIDYACPVHSCPILYKAHYFFAVSTLNSLINPVIYTWRSRDLRREVL 300 9 1 MGSLYSEYLMPNKVQEHYNYTKETLETQETTSRQVASAFIVILCCAIVVENLLVLIAVAR NSKFHSAMYLFLGNLAASDLLAGVAFVANTLLSGSVTLRLTPVQWFAREGSASITLSASV FSLLAIAIERHVAIAKVKLYGSDKSCRMLLLIGASWLISLVLGGLPILGWNCLGHLEACS NSKFHSAMYLFLGNLAASDLLAGVAFVANTLLSGSVTLRLTPVOWFAREGSAFITLSASV TVLPLYAKHYVLCVVTIFSIILLAVVALYVRIYCVVRSSHADMAAPQTLALLKTVTIVLG 1 MGSLYSEYLNPNKVQEHYNYTKETLETQETTSRQVASAFIVILCCAIVVENLLVLIAVAR Gaps 301 RPLOCWRPGVGVGRRRVGTPGHHLLPLRSSSSLERGWHMPTSPTFLEGNTVV 353 RPLOCWRPGVGGRRRGGTPGHHLLPLRSSSSLERGMHMPTSPTFLEGNTVV 353 ö Length 353; Indels Human sphingolipid receptor Edg5 protein SEQ ID NO:508.                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention describes antigenic peptides (I) comprising: (a) any one of 1601 sequences (see ABP82019 to ABP83619) of 12-24 amino caids. Also described: (1) an assay for the detection of a particular G protein-coupled receptor (GPCR) or a candidate polypeptide in a sample; and (2) an isolated antibody having high specificity and high affinity or articular GPCR. (I) can be used as GPCR modulators and in gene therapy. The antigenic peptides for GPCRs are useful in detecting an antibody against a particular GPCR. and in the production of specific antibody against a particular GPCR. and in the production of specific antibodies. The peptides and antibodies are also useful for detecting the presence or absence of corresponding GPCRs. The antigenic peptides for GPCRs and antibodies are useful for diagnosing and designing drugs for careaing immune-related disease, immunological-related disease, coll recating immune-related diseases, immunological-related disease, coll sease, atherosclerosis, bacterial, fungal, protozoan or viral infections, atherosclerosis, bacterial, fungal, protozoan or viral infections, atherosclerosis, bacterial, fungal, protozoan or viral infections, cosecoarthritis, osteoporossis, cancer, cardiomyopathy, chronic and acute inflammation, allergies, Crohm's disease, graft versus host disease, parkinson's disease, multiple sclerosis, pain, psoriasis, concertivities, trauma, tuberculosis, obesity, nausea, hypertension, hyperension, renal disorders, rheumaciod arthritis, trauma, ulcers, or any other disorder in which GPCRs are involved. The antibodies may be used in immunoassays and immunodiagnosis, ABZ2223 to ABZ22869 encode GPCR proceins given in ABSP1675 to ABZ2289 encode exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

The genes are preferably gene families such as the G protein coupled receptor family, tyrosine oxidase receptor family, or ion channel gene family. The methods may be used in treatment of cancers, including prostate, ovarian, stomach, bladder, breast, and cancer of the intestines. EDG-1 and EDG-2 receptor agonists and antagonists may be used in the treatment and prevention of atherosclerosis, myocardial infarction, infarct or ischaemic disease of the brain. This sequence represents a protein of human EDG-5 of the invention.

The present invention describes a method for identifying an increase in risk for Type II diabetes mellitus and/or venous thrombosis/pulmonary embolism, comprising determining the presence of amino acid exchange at position 286 from Val to Ala in the EDGS protein. Also described: (1) a method for screening pharmaceuticals useful for treating and/or preventing type II diabetes and/or venous thrombosis/pulmonary embolism, where a cell or cell extract is used that contains EDGS with the amino acid exchange, or the Variation in the nucleotide sequence of EDGS contains or the EDGS-286-AA; (2) a method for adapting the dosage of the pharmaceutical described above by testing the human cell for the presence of EDGS with the amino acid exchange, or the Variation in the nucleotide sequence of EDGS procein or the EDGS-286-AA; (3) a method of selecting patients who will respond type II diabetes and/or venous thrombosis/pulmonary embolism by testing the probe of the respective

patient for the presence of EDG5 with the amino acid exchange, or the variation in the nucleotide sequence of EDG5 protein or the EDG5-286-AA; and (4) a test kit for testing the presence of the amino acid exchange, or the variation in the nucleotide sequence of EDG5 protein or the EDG5-286-AA. EDG5 has antidiabetic and thrombolytic activities, and can be used in gene therapy. The methods are useful for identifying an increase in risk for type II diabetes mellitus and/or trombosis/pulmonary embolism, and for screening pharmaceuticals useful for treating type II diabetes mellitus and/or venous thrombosis/pulmonary embolism. The methods are also useful for adapting the dosage of a pharmaceutical useful for treating the above diseases. The methods are useful for selecting patients who will respond to the pharmaceutical. The present sequence represents the human EDG5 protein, which is used in an example

This invention relates to a novel method for identifying an increase in risk for type II diabetes mellitus, venous thrombosis, pulmonary embolism or a combination thereof. Specifically, it refers to a the endothelial differentiation gene 5 (EDG5) located on chromosome 19913.2, which encodes a G protein coupled receptor protein. The present invention describes an immunochemically reactive labelled antibody based kit that can be used to identify the Val286Ala variation in the EDG5 protein encoded by a single nucleotide polymorphism. Furthermore, this allele encoding the V286A variant represents a genetic marker that can be useful for preventexive treatments of the aforementioned diseases, as well as for prevent action in phase or clinical studies. This polypeptide sequence is the human EDG5 protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Identifying an increase in risk for type II diabetes mellitus, venous thrombosis, pulmonary embolism or its combination in subject by determining whether amino acid residue at position 286 of EDG5 protein is
                                             3 protein coupled receptor; EDGS; type II diabetes mellitus;
venous thrombosis; pulmonary embolism; endothelial differentiation gene;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       1 MGSLYSEYLNPNKVQEHYNYTKETLETQETTSRQVASAFIVILCCAIVVENLLVLIAVAR

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ઠ
                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to an isolated nucleic acid encoding a mammalian Edg7 receptor. The mammalian Edg7 receptor proteins and nucleic acid encoding the proteins are useful for diagnosing and treating an abnormality associated with the activity of the mammalian Edg7 receptors, ciaberes, respiratory disorder, asthma, immune disorder, hypertension, disorder, memory disorder, obssity, pain, psychotic behaviour, affective disorder, migraine, cancer, AIDS, wound healing, or ischemia-reperfusion injury-related diseases. The nucleic acids and proteins are also useful in developing and designing drugs with higher specificity and fewer side effects. The nucleic acid such encoding mammalian Edg7 receptors and antisense oligonucleotides complementary to the nucleic acid sequences. The methods are also useful for identifying agonists and antagonists of Edg7 receptors. The present sequence represents the amino acid sequence of the human Edg5 receptor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              240

The invention relates to a compound 8-80 nucleobases in length targeted to, and which specifically hybridises with a nucleic acid molecule account of ancoding endothelial differentiation gene 5 (EDG5, a G protein coupled receptor, involved in development, wound healing, tissue regeneration, cellular proliferation, apoptosis, cancer, angiogenesis and inflammation), and inhibits the expression of EDG5, i.e. is an antisense inflammation), and inhibits the expression of EDG5, i.e. is an antisense compound and a carrier or diluent and a method for screening an antisense compound (by contacting a preferred target region of a nucleic acid molecule encoding EDG5 with one or more candidate antisense compounds that inhibit the expression of a nucleic acid encoding EDG5). The compound, composition and methods are useful for treating a disease or condition associated with EDG5, such as a hyperproliferative disorder, developmental disorder or a disease or condition arising from aberrant apoptosis. They are also useful in research and disquostics for modulating the expression of EDG5. Experimental protocols are described but no results are given. The present sequence is the human EDG5 protein.

compounds that modulates diagnosing and treating disease condition associated with GPCR dysfunction e.g. autoimmune diseases, angina pectoris, Parkinson's disease.

12-AUG-2004 (first entry)

ADO57997;

Claim 151; SEQ ID NO 394; 542pp; English.

The invention relates to human and mouse G protein-coupled receptors (GPCRS) and nucleic acids encoding them. The invention also relates to sequences at least 90% identical to the GPCR proteins and nucleic acids cof the invention; methods of treating, preventing or diagnosing diseases associated with GPCRs of the invention; methods of screening for compounds useful in the treatment of GPCR-related diseases, a transgenic compounds useful in the treatment of GPCR-related diseases, a transgenic computed in a GPCR transgene or in an endogenous GPCR gene; cells derived from the transgene or in an endogenous GPCR gene; cells derived computed in a different GPCR population; and wite, each of which has a mutation in a different GPCR population of the invention. The probes which hybridise to GPCR populations of the invention. The comprising a GPCR nucleic acids and proteins may be used in the diagnosis, treatment or prevention of a wide variety of diseases including neurological disorders (e.g., Alzheimer's disease, disorders of the adrenal gland; disorders of the colon or intestine of disorders of the adrenal gland; disorders of the colon or intestine or myocardial infarction); muscular disorders (e.g., autoimmune disorders or anaemia or leukaemia); immune disorders (e.g., autoimmune disorders (e.g., atthirtis, gout or osteoporosis); metabolic or nutritive disorders or atthirtis, gout or osteoporosis); metabolic or nutritive disorders or hearts or any disorders of the kidney, liver, lung, breast, overly the property of the property of the disorders or the disorders of the colon or intention of a disease or vitamin deficiency-related diseases or vitamine the protein and the prot uterus, prostate, testis, skin, stomach, pancreas, spleen, thymus and thyroid (e.g., cancers). The present sequence represents a GPCR of the invention. Note: The full sequence data for this patent did not form part of the printed specification; those sequences not shown were obtained in electronic format directly from WIPO at the print pub/published_pct_sequences.

diseases. The compositions have the following activities: analgest, antiarrhythmic, antiarteriosclerotic, antiasthmatic, antibacterial, antiarrhythmic, antiarteriosclerotic, antiasthmatic, antibacterial, antiarrhythmic, antiarrer, antipackinsonian, antiarcer, cardiant, cerebroprotective, dermatological, gynecological, neuroprotective, cerebroprotective, dermatological, gynecological, neuroprotective, corporation, and virucide. The regulators of EDG5 are useful concropic, vasotropic, and virucide. The regulators of EDG5 are useful cardiovascular diseases, disorders of the peripheral and central nervous system, and respiratory diseases in a mammal. They are also useful for the regulation of EDG5 activity in a mammal having the disease.

Cardiovascular disease includes heart failure, myocardial infarction, cardiovascular disease includes heart failure, myocardial infarction, is chaemia, arrhythmias, and atherosclerosis. Examples of disorders of the gastrictis, gastric ulcers, and chronic pancreatitis. Examples of satritis, and chronic pancreatitis. Examples of satritis, dysmenorrhoea, and infartility. Disorders of the peripheral and central nervous system include Parkinson's disease, dementia, multiple sclerosis, ctroke, and Alzheimer's disease. Respiratory diseases can be asthma or The invention relates to a novel method for screening for therapeutic agents. The method comprises contacting a test compound with an endothelial differentiation sphingolipid G-protein-coupled receptor 5 compound, or determining EDG5 polypeptide and detecting binding of the test compound, or determining EDG5 polypeptide activity at a certain test compound concentration of the test compound. The invention further discrets of the gastroenterology system, reproductive diseases, disorders of the gastroenterology system, reproductive diseases, disorders of the partipheral and central nervous system, and respiratory diseases in a mammal. The invention also comprises a pharmaceutical composition for the treatment of the diseases above comprising an EDG5 polypeptide, an EDG5 polypeptide, or a therapeutic agent which binds to an EDG5 polypeptide or which regulates the EDG5 polypeptide or a court as a small molecule, an RNA molecule, an antisense oligonucleotide, a polypeptide, an entipedy, or a ribozyme; and preparation of a polypeptide, an antibody, or a ribozyme; and preparation of a polypeptide composition useful for treating the above defined

ö
chronic obstructive pulmonary disease. The nucleotide sequences encoding EDGS are useful as hybridization probes, in constructing oligomers for PCR, for chromosome and gene mapping, in the recombinant production of EDGS, in generating antisense DNA or RNA and in molecular biology techniques that have not yet been developed. EDGS polypeptides are useful for immunishing a mammal to produce polyclonal antibodies and for diagnostic purposes. This sequence represents the human EDGS receptor protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                    121 FSLLAIAIERHVAIAKVKLYGSDKSCRMLLLIGASWLISLVLGGLPILGWNCLGHLEACS 180
